

Safety first

Safety first

With health and safety being at the forefront of today's businesses, tailifts now play a critical role in providing lifting solutions for a wide range of vehicle applications. To minimise the risk of the operator falling from the raised tailift platforms, we encourage the use of our proven and very cost effective guards. We have developed a solution for most applications, which have been included within this booklet.

Detachable guards

This is the simplest solution, the guards can be fitted to any type of platform, on any type of tailift. 'Pockets' set into the platform allow the guard to be dropped into position. When not needed the guards are stored within the vehicle. These type of guards can be retrofitted to tailifts already fitted to vehicles.

Auto erect

Arguably the safest and most user friendly types of guards because they automatically deploy when the platform is opened. The guards are permanently hinged to the tip of the platform, simply closing the platform causes the fences to fold up automatically. Preferred by operators, because they have no extra work to do but also by vehicle owners because the guards must always be used.

Dual mode

Our latest innovation, these guards offer the best of both worlds. They operate in the same way as the auto erect but with an additional feature. Instead of being permanently fixed to the platform, we have designed a quick release system to allow the guards to be manually pushed upwards and held securely in the upright position. This permits the platform to be loaded/unloaded from the side. When the guards are next required, simply unlatch from the vertical position and re-attached to the end of the platform.

Wrap around

These are our original guards introduced many years ago. Probably still the most popular because they have to be deployed to use the tailift yet they can rotate through 180° to allow the platform to be loaded/unloaded from the side. The opening and closing operation is quick and simple.

Bespoke guards

If one of our standard type of guards is not ideal for your application, please tell us. We design and manufacture for specific requirements. Current examples include a special version of an auto erect guard hinged along the end of the platform for safe cone laying from a moving vehicle onto the road.
